In light of the more recent attitude that even premature infants have the capacity to experience pain, 19 papers from the first biennial International Forum on Pediatric Pain (1996: Nova Scotia) treat psychometric, neurophysiological, neurobiological, behavioral, and clinical issues in the measurement, management, and research on pain in a population for whom the standard self-report is untenable—except through specially- designed measures (e.g. the Poker Chip Tool and Pain Experience History-Child form). This volume's purpose is to describe concepts and methods concerning assessment of health-related quality of life (HRQOL) in children and adolescents with a special focus on chronic health conditions. The impetus for this book came from a recognition of the increasing importance of HRQOL assessments in the evaluation of treatment outcomes and the need to increase the utilization of HRQOL assessments in research and clinical applications with a range of pediatric populations. The need to develop a volume that describes new research and clinical applications concerning this topic stemmed from several recent developments. There is a continuing need for evaluations of the efficacy of medical treatments for children and adolescents, including those with chronic health conditions. To address these critical unmet needs in the field of HRQOL assessment, and to advance scientific methods and clinical applications in this field, a conference was held at Case Western Reserve University. The conference set out to summarize current information concerning the development and implementation of measures of HRQOL assessment, to identify and consider key conceptual and methodological issues in research concerning the measurement of HRQOL, and to recommend priorities to advance the state-of-the-art in research and clinical applications of QOL assessment in children and adolescents with chronic health conditions. This volume summarizes and synthesizes the information that was presented by the conference participants in a series of lively discussions and chapters that were based on the presentations.

Post-burn scar contractures are a commonly encountered problem in the field of plastic and reconstructive surgery. Nevertheless, many physicians still lack adequate knowledge on beneficial treatments. In this up-to-date atlas, leading specialists in post-burn treatment and the reconstruction of post-burn scar contractures depict in detail not only surgical techniques but also a variety of advantageous wound treatments. Many new methods invented by the authors are presented. Operative techniques are depicted in detail, and clear guidance is provided on selection of the most appropriate flap surgery. Advice is also given on how to prevent permanently disabling restriction of joint movement as a result of contractures and how to achieve good aesthetic reconstruction. This atlas is designed to appeal to a wide audience, from beginners to specialists. It will prove invaluable for doctors of every kind who deal with wound management.

Advances in trauma care have accelerated over the past decade, spurred by the significant burden of injury from the wars in Afghanistan and Iraq. Between 2005 and 2013, the case fatality rate for United States service members injured in Afghanistan decreased by nearly 50 percent, despite an increase in the severity of injury among U.S. troops during the same period of time. But as the war in Afghanistan ends, knowledge and advances in trauma care developed by the Department of Defense (DoD) over the past decade from experiences in Afghanistan and Iraq may be lost. This would have implications for the quality of trauma care both within the DoD and in the civilian setting, where adoption of military advances in trauma care has become increasingly common and necessary to improve the response to multiple civilian casualty events. Intentional steps to codify and harvest the lessons learned within the military's trauma system are needed to ensure a ready military medical force for future combat and to prevent death from survivable injuries in both military and civilian systems. This will require partnership across military and civilian sectors and a sustained commitment from trauma system leaders at all levels to assure that the necessary knowledge and tools are not lost. A National Trauma Care System defines the components of a learning health system necessary to enable continued improvement in trauma care in both the civilian and the military sectors. This report provides recommendations to ensure that lessons learned over the past decade from the military's experiences in Afghanistan and Iraq are sustained and built upon for future combat operations and translated into the U.S. civilian system.

The leading figure in qualitative health research (QHR), Janice M. Morse, asserts that QHR is its own separate discipline—distinct from both traditional health research and other kinds of qualitative research—and examines the implications of this position for theory, research, and practice. She contends that the health care environments transform many of the traditional norms of qualitative research and shape a new and different kind of research tradition. Similarly, the humanizing ethos of qualitative health research has much to teach traditional researchers and practitioners in health disciplines. She explores how the discipline of QHR can play out in practice, both in the clinic and in the classroom, in North America and around the world. A challenging, thought-provoking call to rethink how to conduct qualitative research in health settings.

Clinics in Developmental Medicine No. 178 For most children with cerebral palsy, the extent to which they can use their hands is critical to their overall development. Over the last two decades there have been major advances in the understanding of hand function. Particularly in children with cerebral palsy, assessment of hand function has become more exact and the range of possible interventions has expanded. Changes in treatment approaches can be seen in neurorehabilitation, orthopaedic management, developmental pediatrics and rehabilitation including occupational and physical therapy practices. In this book, selected experts from around the world in the fields of neuroimaging, neurology, orthopaedics, anatomy, motor control and motor learning provide fundamental theoretical information for the development of hand function in children with cerebral palsy. The book also shows how theory can be translated into practice by clinicians who provide assessment and intervention services to improve hand use in this population in sections written by researchers in occupational and physical therapy. Linking different fields of knowledge, this book highlights new perspectives and provides the best evidence for different types of intervention. By focusing only on hand function this essential book highlights new concepts for clinicians and others working towards the overall well-being of children with cerebral palsy.

Advanced therapies and technologies, new service delivery methods, and care upgrades in underserved areas are translating into improved quality of life for millions with disabilities. Occupational therapy parallels this progress at the individual level, balancing short-term recovery and adaptation with long-term independence and well-being. This Second Edition of the International Handbook of Occupational Therapy Interventions builds on its ground-breaking predecessor by modelling current clinical standards rooted in scientific evidence-based practice. Its interventions are applied to a diverse range of client disabilities, with many new or rewritten chapters on workplace and vehicle accommodations, smart home technologies, end-of-life planning, and other salient topics. New introductory chapters spotlight core competencies in the field, from assessing client needs and choosing appropriate interventions to evaluating programs and weighing priorities. And for increased educational value, interactive case studies allow readers an extra avenue for honing clinical reasoning and decision-making skills. Of particular note is a new chapter providing a taxonomy—the Occupational Therapy Intervention Framework—and a validation study of its categories and concepts, delineating the occupational therapist's roles and the expected outcomes. Intervention areas featured in the Handbook include: ● Adaptive interventions, OTs manage and facilitate clients' adaptations. ● Learning interventions, OTs teach and the clients learn or relearn. ● Enabling interventions, OTs enable clients to be meaningfully occupied. ● Preventing interventions, OTs prevent ill-health and promote clients' ability to sustain health in daily life. The Second Edition of the International Handbook of Occupational Therapy Interventions is career-affirming reading for all members of rehabilitation teams, including occupational and physical therapists and rehabilitation nurses.
